

Lab Exercise #6: Test Score Analyzer

1 Overview

In this lab, you will write a C program that allows the user to input a small set of test scores and compute basic statistics on the results. The purpose of this lab is to gain practice with arrays and loops in C.

Your program should:

- Request the user how many test scores to analyze.
- Declare an array to store the given number of integer test scores.
- Prompt the user to input each score (using a `for` loop).
- Calculate and output:
 - The average score.
 - The highest score.
 - The lowest score.
- Display all entered scores, followed by the results.
- Format output clearly and label all values.

2 Code Documentation

The very first lines in all of your programming project files should include the standard class header comment block (copy from `header.c`). All bracketed placeholders in the comments should be filled in with the correct information.

As with previous labs, the first output line of your program should include the lab number and both students' names, for example:

```
printf("Lab #6 - Joe Student and Jane Doe\n");
```

3 Sample Run

Your output should match the sample run below.

```
Mark Schwitzerlett and Henri Jacobi
Lab 6 -- October 7, 2025

Enter the number of test scores you wish to analyze: 5

Enter the test scores:
Score #1: 78
Score #2: 83
Score #3: 94
Score #4: 88
Score #5: 73

You entered: 78 83 94 88 73
Average score: 83.20
Highest score: 94
Lowest score: 73

...Program finished with exit code 0
Press ENTER to exit console.
```

4 Deliverables

You should turn in a stand-alone, complete application program (your C source code, a single “.c” file) containing a `main()` function. All labs and projects this semester will be submitted in Gradescope (via a Canvas assignment).

Your file should be named: `Lab#6_FirstName_LastName.c`

Due date: The lab is due at the end of your lab period.

Be sure to save a copy of your .c file.

Due date: The lab is due at the end of your lab period, either Tuesday, October 7th, or Thursday, October 9th.
